The manufacture of food products, beverages and tobacco sector is characterised by lower than average job tenure.

Workers in this sector are more likely to have lower than average levels of education and fall into the low income categories.

The sector has an unfavourable profile in relation to some working conditions: exposure to physical risks, non-standard working hours, skilled work, and job control.

Methodology

The European Working Conditions Survey (EWCS) is carried out every five years by the European Foundation for the Improvement of Living and Working Conditions (Eurofound), a tripartite European agency based in Dublin. The questionnaire is developed by the Eurofound team in close cooperation with an expert questionnaire development group. This group comprises representatives of the European social partners, other EU bodies (European Commission, Eurostat, European Agency for Safety and Health at work), international organisations (OECD, ILO), national statistical institutes, as well as leading European experts in the field. The sample of the EWCS is representative of persons in employment (according to the Eurostat definition this comprises both employees and the self-employed aged 15 years and over) resident in the countries covered for the respective periods. In each country, the EWCS sample followed a multi-stage, stratified and clustered design with a random walk procedure for the selection of the respondents at the last stage. All interviews were conducted face-to-face in the respondent’s own household.

Key findings

The manufacture of food products, beverages and tobacco sector is characterised by lower than average job tenure.

Workers in this sector are more likely to have lower than average levels of education and fall into the low income categories.

The sector has an unfavourable profile in relation to some working conditions: exposure to physical risks, non-standard working hours, skilled work, and job control.

Background

Eurofound’s European Working Conditions Surveys (EWCS) have been carried out every five years since 1991. Each wave of the survey provides an overview of the state of working conditions throughout Europe and indicates the nature and extent of changes affecting the workforce and the quality of work. The fieldwork for Eurofound’s most recent edition of the EWCS was carried out in 2005 in 31 countries, including the 27 EU Member States, plus candidate countries Croatia and Turkey, as well as EFTA countries Norway and Switzerland. In 2005, the sample size was set at 1000 per country (600 for Cyprus, Estonia, Luxembourg, Malta and Slovenia).

Differences according to other socio-demographic characteristics (e.g. gender, age, employment status) between the food products, beverages and tobacco sector and the average for all sectors are not statistically significant.

Following the 2005 survey, Eurofound asked TNO Work & Employment to perform a secondary statistical analysis of the data from the fourth EWCS 2005 on sector profiles with regard to working conditions in the 27 Member States. For the analysis, NACE Revision 1.1 was applied. The findings are set out in 26 fact sheets, each covering one of the 26 sectors in the NACE classification. Each fact sheet presents:

- a profile of the sector’s socio-demographic characteristics based on data at NACE at 1 and 2 digit level;

- a profile of working conditions in the sector based on data at NACE at 1 and 2 digit level.

This fact sheet presents a snapshot of working conditions in the manufacture of food products, beverages and tobacco sector (NACE Rev 1.1 D15–16).

Fact sheet

Food, beverages and tobacco

In terms of income levels, the food products, beverages and tobacco sector has a higher proportion of workers falling in the medium–low income band (36.9%) than the average for all sectors taken together (24.3%).

Moreover, the sector has a higher than average concentration of employees with only primary education (10.2% compared with an average of 5.3%) and upper secondary education (55.8% compared with an average of 44.5%). Workers with a higher level of education are less likely to work in this sector.

Working conditions and outcomes

The figure below shows specific dimensions of working conditions with favourable and unfavourable scores in the food products, beverages and tobacco sector, taking as a point of reference mean exposure (0.0 score in the chart below).

Looking at the statistically significant differences only, workers in this sector are particularly exposed to ergonomic risks (exposure to tiring or painful positions, carrying or moving heavy loads, standing or walking and repetitive hand or arm movements) and, albeit to a lesser extent, to ambient risks (exposure to vibrations, noise, high/low temperatures, breathing in smoke, fumes, powder or dust, breathing in vapours, handling chemical products or substances).

Workers in this sector are prone to working non-standard hours (night and evening work, Sunday/Saturday work and more than 10 working hours a day). Compared to the average, this sector is also characterised by relatively lower levels of control over the work process (ability to choose or change the order of tasks, methods of work and speed or rate of work) and lower levels of skilled work (use of quality standards in the work process, solving unforeseen problems, job complexity and learning new things).

Gender

Manufacture of food, beverages and tobacco
Men | 55.9% | Women | 44.1%
All sectors | 55.5% | 44.5%

Age

Average | Age group
